

Text can be centred on the page by putting it within the `center` environment, and it will appear flush against the left or right margins if it is placed within the `flushleft` or `flushright` environments. Notice the spelling of `center`—unfortunately \LaTeX doesn't understand the English spelling.

Text within these environments will be formatted in the normal way, in particular the ends of the lines that you type are just regarded as spaces. To indicate a “newline” you need to type the `\\` command. For example:

```
\begin{center}                                one two three
one                                           four
two                                           five
three \\
four \\
five
\end{center}
```
